

Product Requirements Document (PRD)

Innoverse Technologies — E-Commerce Platform

Version	1.1 (Draft)
Date	July 2026
Prepared for	Innoverse Technologies
Status	Draft — for review and iteration
Market	Bangladesh

Changelog (v1.1): Removed customer-facing "sourcing" language throughout (stock status is now simply In Stock/Out of Stock); added safety-stock inventory management for fast-moving SKUs (§6.3); narrowed payment to Cash on Delivery + BanglaQR only (§5.9, §9.1); narrowed shipping to Pathao only (§9.2); guest checkout confirmed with a login nudge, no minimum order value, and VAT-inclusive pricing not broken out at checkout (§5.8, §5.9, §4); added §16, steps to reduce product return rate.

1. Executive Summary

Innoverse Technologies is a Bangladesh-based, online-only e-commerce platform selling retail gadgets and electronics to enthusiasts and everyday customers. Unlike traditional retailers, Innoverse combines **safety stock for fast-moving items** with **on-demand sourcing** for the rest of its catalog — an internal operational model that stays invisible to the customer, who simply experiences a standard, reliable stock and delivery flow. Because there is no physical storefront, the website itself *is* the product — customer experience, trust, speed, and clarity are the primary competitive levers.

This document expands the founder's original requirements into a complete PRD: functional requirements for the storefront and admin panel, non-functional requirements, Bangladesh-specific payment and logistics considerations, an order lifecycle, success metrics, risks, and open questions to resolve before design/development begins.

2. Business Overview

2.1 Business Model

- Online-only, direct-to-consumer e-commerce (no physical retail presence).
- **Source-on-demand + safety stock:** most products are sourced based on market trend, demand, and supplier availability rather than bulk pre-stocked inventory, while fast-moving/high-demand SKUs are backed by a safety stock buffer to keep them reliably available (§6.3). This is an internal operational detail — the storefront always presents a simple, standard stock experience (In Stock / Out of Stock) to the customer, never a "made to order" or sourcing-based narrative (§5.5).
- Revenue from product margin; potential future revenue from featured listings/brand placements once the platform matures.

2.2 Objectives

1. Launch a fast, trustworthy, mobile-first storefront that converts browsers into buyers.
2. Present a simple, standard stock and delivery experience to the customer — In Stock / Out of Stock, honest delivery timelines — while sourcing and safety-stock operations stay entirely behind the scenes.
3. Support the payment and delivery realities of Bangladesh (BanglaQR, COD, nationwide Pathao coverage).
4. Give the admin/ops team the tools to manage a fast-moving, trend-driven catalog without chaos, and to keep product returns low.

2.3 Target Audience

- **Tech & gadget enthusiasts:** early adopters looking for unique, niche, or hard-to-find electronics not commonly available in local markets.
 - **Everyday customers:** buyers looking for common gadgets/accessories (chargers, earbuds, smart devices, home electronics) with reliable service and fair pricing.
 - Primarily mobile-first users — the majority of e-commerce traffic in Bangladesh comes from mobile devices, so mobile UX is not optional polish, it's the primary experience.
-

3. Scope

3.1 In Scope — Version 1 (Launch)

- Customer-facing storefront (browsing, search, product detail, cart, checkout, payment, order tracking, account management).

- Admin panel for product, inventory, order, and content management.
- Bangladesh-specific payment options (Cash on Delivery and BanglaQR) and Inside/Outside Dhaka delivery logic via Pathao.
- Basic marketing tools (homepage carousel/banners, featured categories, discounts/coupons).

3.2 Out of Scope — V1 (candidates for later phases)

- Native mobile apps (iOS/Android) — V1 is a responsive website.
 - Multi-vendor/marketplace functionality.
 - Loyalty/rewards program.
 - Live chat / AI chatbot support (recommended for Phase 2 — see §12).
 - International shipping / multi-currency.
 - Subscription or pre-order-with-deposit flows (recommended addition — see §12).
-

4. Assumptions & Constraints

- Business will maintain **safety stock for fast-moving/high-demand SKUs** and source other items on demand behind the scenes (§6.3). The storefront always uses standard stock language (In Stock / Out of Stock) — sourcing is an internal operations concern, never a customer-facing narrative.
 - Primary market is Bangladesh; primary delivery split is **Inside Dhaka vs. Outside Dhaka**, each with different cost/time expectations, fulfilled entirely through **Pathao**.
 - Payment at launch is limited to **Cash on Delivery and BanglaQR** — no separate card gateway or individual MFS integrations. COD will likely remain the dominant method, so the platform must be designed to reduce COD risk (fake/failed orders), not just accept it.
 - **Displayed prices are VAT-inclusive**; VAT is not itemized separately anywhere in the customer-facing experience.
 - **No minimum order value** — checkout is available at any cart total.
 - **Guest checkout is allowed**, but the flow nudges customers to log in or create an account so they have a record of their order — it does not gate checkout behind login.
 - Team has not yet finalized tech stack, budget, or timeline — this PRD is scope-first and stack-agnostic, with a recommendation in §10.
 - Requirements will evolve iteratively during design — this document should be treated as a living artifact, versioned as it changes.
-

5. Functional Requirements — Frontend (Customer-Facing)

5.1 Global Header (all pages)

- Logo (links to homepage).
- Search bar with auto-suggest (products, categories, brands) and recent/popular searches.
- Primary navigation menu (categories, deals, brands).
- Account/Login icon → login, register, or account dropdown if logged in.
- Dark/Light mode toggle (persists via user preference/cookie).
- Cart icon with live item-count badge.
- *Addition:* Sticky header on scroll for quick access to search/cart while browsing long pages.

5.2 Homepage

1. Detailed, easy-to-navigate mega-menu (categories with sub-categories, images/icons for scannability).
2. Hero carousel — latest deals, exclusive/featured items, seasonal campaigns (admin-manageable, scheduled start/end dates).
3. Quick category shortcuts (icon-based tiles: e.g., Audio, Smart Home, Wearables, Accessories).
4. Latest products / new arrivals section.
5. Deals / discounted items section.
6. *Addition:* "Trending Now" or "Most Wanted" section — fits the trend-driven catalog and doubles as informal demand-signal marketing.
7. *Addition:* Trust strip — payment method icons, delivery coverage, return policy badge, "authentic products" assurance (important for gadget buyers wary of counterfeits).
8. Footer (see §5.3).

5.3 Footer

- Terms & Conditions, FAQ, Privacy Policy, Cookie Policy, Return Policy, Payment Policy.
- Social media links.
- Parcel/order tracking (quick tracking-number lookup, no login required).
- *Additions:* About Us, Contact Us (phone/email/WhatsApp), Warranty Policy (relevant for electronics), Careers (optional), Sitemap.

5.4 Category / Product Listing Page (*new — implied but not in original list*)

- Grid/list toggle view.
- Filters: price range, brand, category, availability (In Stock / Out of Stock), rating, discount.

- Sort: price (low–high/high–low), newest, best-selling, top-rated.
- Pagination or infinite scroll.
- Breadcrumb navigation.

5.5 Product Detail Page

- Image carousel/gallery with zoom; images update based on selected color/variant.
- Product name, short description, brand.
- **Stock status:** a simple *In Stock* or *Out of Stock* indicator — kept deliberately simple, with no visibility into internal sourcing or supply operations.
- Quantity selector.
- Add to Cart, Buy Now, Add to Favourites/Wishlist buttons.
- Color/variant selector that updates the product image in real time.
- Price display: original price, discount amount, discount percentage, final price.
- Detailed description (specs table recommended for electronics — dimensions, compatibility, warranty, box contents).
- *Additions:*
 - Product reviews & ratings (post-delivery, verified purchase only).
 - Related / "You may also like" and "Frequently bought together" sections.
 - Warranty/return eligibility info specific to the product.
 - Share product (social/link copy).
 - Estimated delivery date shown before add-to-cart (based on delivery zone and Pathao timelines), not just after checkout.

5.6 Search & Filter

- Global search with type-ahead suggestions, typo tolerance, and category-aware results.
- Filter/sort as in §5.4, consistently applied across search results.

5.7 Cart (Slide-out Drawer)

- Opens from the side (left, per original spec — confirm left vs. right with design team, right is more conventional in most markets but left is fine if intentional) on Add-to-Cart or cart-icon click.
- Line items: product image/name/variant, quantity (editable), unit price, line total.
- Subtotal, applied discounts/coupons, estimated total.
- Remove item / save-for-later option.
- Clear "Proceed to Checkout" CTA.
- Empty-cart state with a call to action (e.g., link to trending products).

5.8 Checkout Page

- **Guest checkout allowed by default** — never gated behind login, to protect conversion. The flow should clearly but gently nudge the customer to sign in or create an account,

framed around convenience ("Sign in to save this order to your account and track it later") rather than as a requirement.

- Fields: full name, delivery address, contact number, delivery zone (**Inside Dhaka / Outside Dhaka**, driving both shipping cost and estimated delivery time).
- Saved addresses for logged-in customers.
- Order summary sidebar (persistent across checkout steps).
- Coupon/promo code field.
- **No minimum order value** — checkout proceeds at any cart total.
- *Addition*: Delivery time estimate shown per item, based on delivery zone and Pathao's timelines, and a combined "expected delivery window" for the order.

5.9 Payment Page

Kept deliberately simple — two options at launch:

- **Cash on Delivery (COD).**
- **BanglaQR**: Bangladesh Bank's interoperable national QR payment standard. The customer scans one QR code at checkout using whichever banking or mobile financial services app they already have — bKash, Nagad, Rocket, or a participating bank app — and pays directly from their own account. Because it's interoperable by design, this single option covers all the major digital payment rails without the platform needing separate bKash/Nagad/card integrations. See §9.1 for integration notes.
- *Addition* — *COD risk mitigation*: optional small non-refundable advance/deposit (via BanglaQR) on COD orders, and/or SMS/call verification before dispatch, since return-to-origin (failed COD delivery) is a known cost driver in Bangladesh e-commerce.
- Clear breakdown: item total, discount, delivery charge, grand total. **Prices are VAT-inclusive and VAT is not shown as a separate line item.**

5.10 Order Confirmation

- On successful order placement: confirmation modal/page with a thank-you message, order/tracking number, order summary, and estimated delivery date.
- Automatic confirmation via SMS and/or email (see §5.13).
- *Addition*: If the customer checked out as a guest, this screen also prompts a quick account creation (pre-filled from their checkout details) so they have a record of the order — framed as a convenience, not a requirement.

5.11 Customer Portal / Account

- Register/login (email/phone + password, and/or OTP login — OTP is common and trusted in the Bangladeshi market).
- Manage saved addresses (multiple, with a default).
- Order history: view past orders, invoices/receipts.

- **Live order tracking:** current status with a visual timeline (Placed → Confirmed → Processing → Shipped → Out for Delivery → Delivered), plus Pathao tracking link/number once shipped.
- Manage wishlist/favourites.
- Manage account details, password/PIN, logout.
- *Addition:* Return/refund request flow initiated from order history.

5.12 Wishlist / Favourites

- Add/remove from product page and listing pages.
- Dedicated wishlist page; move-to-cart action.
- *Addition:* "Notify me" toggle for out-of-stock items — the customer is simply offered a notification when it's back, with no visibility into why it was unavailable.

5.13 Notifications

- Transactional SMS and/or email at key milestones: order placed, confirmed, shipped, out for delivery, delivered, and for any status delay (especially relevant when delivery windows vary by zone or item).
- *Addition:* WhatsApp notifications, increasingly used by Bangladeshi e-commerce for its high open rates, as a Phase 2 option.

5.14 Responsive & Performance

- Fully responsive across mobile, tablet, desktop, with mobile treated as the primary experience given traffic patterns.
- Fast page loads and lightweight image handling (see §8.1).

6. Functional Requirements — Admin Panel

6.1 Dashboard (Home)

- At-a-glance metrics: today's orders, revenue, pending fulfillment, low-stock / safety-stock alerts, top-selling products.

6.2 Product Management

- Add/edit/delete products with all storefront-facing fields: name, short & long description, category, brand, images (multiple), color/variant options, price, discount amount/percentage, SKU, specs table.
- Stock quantity and customer-facing status (In Stock / Out of Stock) — kept simple on the storefront; internal sourcing detail lives separately in §6.3.

- SEO fields (meta title/description, URL slug).
- Publish/Draft/Archived status toggle.
- Bulk import/export (CSV) for managing large or fast-changing catalogs efficiently.

6.3 Inventory Management

- Track stock quantity per product/variant; the customer-facing status (In Stock / Out of Stock) can flip automatically at zero quantity, or be set manually for items awaiting restock.
- **Safety stock:** flag specific SKUs as fast-moving/high-demand and set a minimum safety-stock threshold for each. The dashboard alerts the ops team when a flagged item drops below its threshold, so it can be reordered before it actually runs out.
- Low-stock and reorder alerts for the ops team — **internal only, never shown to the customer.**
- Internal sourcing/supplier notes per product (source, lead time) for the team's own planning — this stays entirely out of the customer-facing storefront, consistent with keeping the sourcing model invisible to customers (§2.1).

6.4 Category & Brand Management

- Create/edit/reorder categories and sub-categories.
- Add/edit brands (name, logo, description) — brand pages optional for Phase 2.

6.5 Order Management

- Order list with filters (status, date, payment method, delivery zone).
- Order detail view: items, customer info, payment status, delivery zone, assigned courier.
- Update order status along the fulfillment pipeline (§7).
- Generate/print invoice and shipping label.
- Process refunds/store credit for returns or cancellations.
- Flag/manage failed COD or return-to-origin (RTO) orders.
- Attach a packing photo/video and log the return reason on any returned order — feeds directly into the return-reduction process in §16.

6.6 Customer Management

- View customer list, order history per customer, contact details.
- Ability to block/flag customers with repeated failed COD orders (a real operational need in COD-heavy markets).

6.7 Marketing & Promotions

- Manage homepage carousel/banners (image, link, schedule).
- Create discount codes/coupons (percentage, flat amount, min. order value, expiry, usage limits).

- Manage "Featured," "Trending," and "Latest Deals" product collections shown on the homepage.

6.8 Content Management

- Edit footer/static pages (Terms, FAQ, Privacy Policy, Cookie Policy, Return Policy, Payment Policy, About, Contact) without needing a developer.

6.9 Shipping & Logistics Management

- Configure delivery zones (Inside Dhaka / Outside Dhaka) and associated charges/timelines.
- Hand off orders to **Pathao** and record tracking numbers against each order.
- Recommended: integrate Pathao's merchant API for automatic status sync, so delivery updates flow into the order timeline (§7) without manual entry.

6.10 Payment & Finance

- View payment status per order (Paid / COD Pending / Refunded).
- Reconcile settlements from the BanglaQR acquiring partner/bank.
- Basic sales and revenue reports.

6.11 Roles & Permissions

Recommended baseline roles (can be refined later):

Role	Access
Super Admin	Full access, including user/role management
Product Manager	Products, inventory, categories, brands
Order/Fulfillment Manager	Orders, shipping, returns/refunds
Marketing	Banners, coupons, featured collections, content pages
Customer Support	Customer info (read-only), order status (read/limited update)

6.12 Reports & Analytics

- Sales over time, best-selling products, category performance.
- Delivery performance (on-time %, RTO rate via Pathao) — important given COD/RTO is a known cost driver.

- **Return rate by product/category, broken down by reason** (defective, wrong item, changed mind, etc.) — the core data source for the return-reduction process in §16.
 - Traffic and conversion basics (can also live in Google Analytics/GA4, integrated separately).
-

7. Order Lifecycle / Status Workflow

Order Placed → Confirmed → Processing → Ready to Ship →

Shipped (Pathao) → Out for Delivery → Delivered → Completed

↘ Cancelled (by customer/admin, pre-shipment)

↘ Returned → Refunded / Store Credit

↘ Failed Delivery / RTO → Re-attempt or Refund

- Each transition should trigger a customer notification (§5.13) and be visible on the tracking timeline (§5.11).
 - **"Processing" is a single neutral status** covering whatever happens internally — picking, sourcing, packing, QC — so operational detail never surfaces to the customer, while delivery estimates (§5.8) still keep them honestly informed on timing.
-

8. Non-Functional Requirements

8.1 Performance

- Target page load under ~2–3 seconds on mobile 4G; optimized/compressed images (especially important for a gadget catalog with many product photos).
- Lazy-loading for images below the fold.

8.2 Security & Compliance

- SSL/HTTPS across the entire site.
- Prefer a **hosted/redirect payment flow** from the BanglaQR acquiring partner (customer redirected to a secure payment page to scan and pay) rather than handling any banking credentials directly on the platform.
- Secure authentication (hashed passwords, optional OTP), rate-limiting on login/checkout to prevent abuse.

- Customer data protection in line with Bangladesh's Digital Commerce Operation Guideline and general data-protection best practice.

8.3 Scalability

- Architecture should handle traffic spikes during promotional campaigns (flash sales, festival seasons like Eid) without degradation.

8.4 SEO

- Clean URLs, meta tags, structured data (schema.org Product markup) for rich search results, sitemap.xml.

8.5 Accessibility

- Reasonable baseline accessibility (readable contrast in both dark/light modes, alt text on images, keyboard-navigable menus).

8.6 Browser/Device Compatibility

- Latest versions of Chrome, Safari, Firefox, Edge; iOS and Android mobile browsers, given mobile-first traffic.

8.7 Availability

- Target uptime (e.g., 99.5%+), with monitoring/alerting on downtime, especially during active promotions.

9. Bangladesh-Specific Considerations

9.1 Payment Options

Payment at launch is intentionally kept to two methods:

Option	Notes
Cash on Delivery (COD)	Must remain available regardless of digital options — still the most trusted method for many Bangladeshi shoppers buying electronics from a new/unfamiliar brand.

Option	Notes
BanglaQR	Bangladesh Bank's interoperable national QR payment standard. The customer scans a single QR code at checkout using whichever banking or mobile financial services app they already have — bKash, Nagad, Rocket, or a participating bank app — and pays directly from their own account. Because it's interoperable by design, one integration effectively covers all major digital payment rails, rather than integrating bKash, Nagad, and cards separately. Bangladesh Bank has been actively pushing adoption, mandating banks and financial service providers replace proprietary QR codes with BanglaQR at merchant points.

Integration note: BanglaQR isn't built in-house — it's issued through a bank or a licensed acquirer/aggregator that supports it (e.g., SSLCommerz's Bangla QR product, or a merchant account directly with your business's bank). Worth flagging: **Pathao Pay** — the payments arm of your chosen courier partner (§9.2) — has recently joined the BanglaQR interoperability network and has publicly stated plans to extend it to online checkout. That could eventually let Innoverse run delivery and payment through a single partner relationship; confirm current availability directly with Pathao Pay before committing, since this capability is still expanding.

Recommendation: Launch with COD + BanglaQR via a licensed acquirer/bank partner. This keeps the payment page simple — two clear choices — while BanglaQR's interoperability still reaches the large majority of Bangladesh's digital payment users.

9.2 Shipping & Logistics

Pathao is the sole shipping/logistics partner at launch, covering both **Inside Dhaka** (faster, cheaper) and **Outside Dhaka** (nationwide) delivery, consistent with the checkout's delivery-zone requirement.

Recommendation: Integrate Pathao's merchant API for automatic status sync (tracking numbers, delivery status flowing directly into the order timeline in §7) rather than updating statuses manually. Revisit adding a second courier only if Pathao's coverage or performance in a specific region becomes a real bottleneck — not before.

Operational note: Return-to-origin (failed COD delivery) is a known cost driver in the Bangladeshi market regardless of courier. Consider phone/SMS order verification before

dispatch and/or a small advance payment on COD orders above a certain value to reduce fake/failed orders.

9.3 Regulatory Notes

- Be aware of Bangladesh's **Digital Commerce Operation Guideline** (from the Ministry of Commerce) governing online business practices, refund timelines, and payment escrow-style protections — worth a legal review before launch, particularly for the Terms & Conditions, Return Policy, and Payment Policy pages.
 - Displayed prices are VAT-inclusive and VAT is not itemized separately in the customer-facing experience; confirm the specific treatment and rate with a local accountant to ensure invoices remain compliant even though the breakdown isn't shown to the customer.
-

10. Suggested Technology Stack (*optional — for discussion with your dev team*)

This is a starting point, not a final decision:

- **Frontend:** Next.js (React) for performance/SEO, or a headless setup if flexibility for future channels (app, marketplace) is a priority.
 - **Backend/Admin:** Node.js/Express or a Python (Django) backend with a dedicated admin panel; alternatively, a headless commerce platform (e.g., Medusa, Saleor) to accelerate build time.
 - **Database:** PostgreSQL.
 - **Payments:** BanglaQR via a licensed acquirer/bank partner, e.g., SSLCommerz's Bangla QR product (§9.1).
 - **Hosting:** Cloud provider with CDN for image-heavy product pages (e.g., a provider with good latency to Bangladesh/South Asia).
 - **Notifications:** SMS gateway (local BD provider) + email service (e.g., transactional email provider) + optional WhatsApp Business API for Phase 2.
-

11. Success Metrics / KPIs

- Conversion rate (visits → orders).
- Cart abandonment rate.
- Average order value (AOV).
- Repeat purchase rate.
- Delivery success rate / RTO rate.

- Average page load time.
- Customer satisfaction (post-delivery survey/NPS).

12. Future Enhancements (Phase 2+)

- Native mobile app (iOS/Android).
 - Live chat / WhatsApp support widget.
 - Loyalty/rewards program.
 - Pre-order with deposit for high-demand new arrivals (helps manage demand spikes without exposing stock/sourcing mechanics to the customer).
 - Additional digital payment methods (cards, direct MFS) once transaction volume justifies the extra integration overhead.
 - A second courier partner for redundancy/coverage, once Pathao performance data shows where it's needed.
 - Product Q&A section.
 - Multi-vendor marketplace expansion.
 - Personalized recommendations (browsing/purchase-history based).
 - Loyalty program / referral system.
-

13. Risks & Mitigations

Risk	Mitigation
Item marked "In Stock" but actually delayed internally (sourcing/restock lag)	Safety stock thresholds and low-stock alerts (§6.3); only mark an item In Stock when it's reliably available
High COD return-to-origin (RTO) rate	SMS/call verification, optional deposit on high-value COD orders, Pathao performance tracking
High post-delivery product return rate (defects, mismatched expectations, buyer's remorse)	Dedicated set of return-reduction measures — see §16
Trust concerns as a new, unfamiliar online brand selling electronics	Clear return/warranty policy, visible trust badges, reviews, responsive customer support

Risk	Mitigation
BanglaQR/acquirer downtime or failed transactions at checkout	COD as reliable fallback; monitor acquirer uptime
Single-courier dependency (Pathao) creating a coverage or performance bottleneck	Monitor on-time/RTO rate by region; keep a second courier as a Phase 2 contingency (§12)
Stale inventory data leading to selling items that are actually unavailable	Keep stock quantity/status tightly synced between admin and storefront; auto-flip to Out of Stock at zero quantity

14. Open Questions / Decisions Needed

Decided (as of this revision): payment is COD + BanglaQR only; shipping is Pathao only; guest checkout is allowed with a login nudge; there's no minimum order value; prices are VAT-inclusive and VAT isn't shown separately; safety stock will be maintained for fast-moving/high-demand SKUs.

Still open:

1. Which BanglaQR acquirer/bank partner to use (e.g., SSLCommerz's Bangla QR product vs. a direct bank merchant account), based on fees and settlement speed — and whether to revisit Pathao Pay once it extends BanglaQR to online checkout.
 2. What is the target launch timeline and budget, to help prioritize V1 scope vs. Phase 2 features?
 3. Which SKUs qualify as "fast-moving/high-demand" for safety stock at launch — based on any historical sales data, or founder judgment until data exists?
 4. What's the return policy window and conditions (e.g., 7-day, unopened vs. opened, defective-only vs. change-of-mind)? This directly feeds the return-reduction measures in §16.
-

15. Proposed Visual Style Direction

Since there's no existing brand identity yet, this is a proposed starting point — grounded in the product itself rather than a generic e-commerce template — for your designer/developer to react to and refine.

15.1 Concept: "The Spec Sheet"

Position Innoverse visually as **the technician, not the hype-seller**. The direction borrows its visual language from the objects the audience already trusts and reads fluently: datasheets, multimeter readouts, PCB silkscreen, spec tables. Every color and label carries functional meaning (a stock status, a price, an order state) rather than existing purely for decoration — which also reinforces the platform's promise of clear, simple stock and delivery information, without ever surfacing internal supply-chain detail to the customer (§5.5). It should feel precise, quietly confident, and a little bit workshop — not loud, not luxury, not another blue-and-white marketplace template.

15.2 Color Palette

Name	Hex	Role
Fog	#F3F4F1	Light-mode background ("paper")
Graphite	#17191C	Dark-mode background
Ink	#1C1E20	Primary text (light mode); becomes #EDEFF0 on dark
Signal Amber	#FF7A29	Primary accent — CTAs, discounts, "Buy Now," price emphasis
Trace Blue	#2F6FED	Secondary accent — links, and order-tracking states (Processing, Shipped, Out for Delivery)
Circuit Green	#2BB673	Success/positive — "In Stock," Delivered, confirmations

Amber, blue, and green function like status LEDs on a device: amber = act now (CTAs, discounts), blue = in progress (order tracking), green = good to go (in stock, delivered). This gives stock and order states a consistent, native visual vocabulary across the whole site instead of ad hoc badge colors.

15.3 Typography

Role	Typeface	Usage
Display	Space Grotesk	Headlines, category titles — geometric with a slightly technical edge, used with restraint (large sizes only)
Body	IBM Plex Sans	Body copy, descriptions, UI labels — a face genuinely designed for technical/engineering documentation, so it reads as credible on spec-heavy product pages
Data / Numerals	IBM Plex Mono (or JetBrains Mono)	Prices, discount %, SKUs, order/tracking numbers, countdowns — set with tabular figures

All three are free and widely available (Google Fonts), so there's no licensing friction for development.

Signature element: prices, discount percentages, delivery-date estimates, and order-tracking numbers are all set in the monospace data face — like a multimeter or spec-sheet reading. It's the one deliberate "risk" in the system: it makes numbers feel measured and precise rather than shouted, and it's something a competitor's generic template won't have.

15.4 Layout Notes

- Grid-based product listings; generous whitespace; thin 1px hairline dividers between sections (like a PCB trace or a spec-table row) instead of heavy drop shadows.
- Minimal border-radius — sharp-ish corners on cards and buttons (4–6px), reinforcing the "instrument panel" feel rather than a soft, plush consumer-app look.
- Every product card carries a small **status dot** (green = in stock, grey = out of stock) next to a monospace price. The same dot-plus-label pattern reappears in the order-tracking timeline using blue for in-progress states (Processing, Out for Delivery) — one consistent visual system for "where things stand," everywhere on the site.

[product photo]	
• IN STOCK	← status dot + mono label
Wireless ANC Earbuds	← Space Grotesk
₣ 3,450 ₣2,990 -13%	← IBM Plex Mono, tabular

15.5 Light / Dark Mode

Token	Light	Dark
Background	Fog #F3F4F1	Graphite #17191C
Surface (cards)	#FFFFFF	#1F2226
Text	Ink #1C1E20	#EDEFF0
Border/divider	#DEDFDB	#2B2E32
Accents	Same amber/blue/green, unchanged	Same hues, +8–10% lightness for contrast

Keeping the accent hues identical across modes (only adjusting lightness) keeps the "status LED" language consistent regardless of which mode the customer is in.

15.6 Motion

Restrained by default: a subtle lift + shadow on card hover, a soft pulse on the blue "Out for Delivery" indicator in the order-tracking timeline to imply it's actively updating, snappy (not animated) page transitions. Respect `prefers-reduced-motion`. No large gradient washes or scroll-triggered fireworks — the personality lives in type and the status system, not in animation.

15.7 What This Deliberately Avoids

To keep this from reading as a generic template, it steers away from the current default AI-design clichés: no warm-cream-and-serif-terracotta look, no near-black-background-with-a-single-acid-green-accent look, and no dense broadsheet/hairline-newspaper layout. It also avoids the generic "big blue trust-badge

marketplace" look most regional e-commerce sites default to — the goal is for Innoverse to look like it was built by people who understand the products, not like a template with a logo swapped in.

16. Steps to Reduce Product Return Rate

Returns on electronics are typically driven by five root causes: unclear expectations, defects, wrong item shipped, "didn't know how to use it," and simple change-of-mind. Each has a concrete, low-cost fix:

16.1 Set accurate expectations before purchase

- Real product photography from multiple angles (not just manufacturer stock images) — customers should see the actual item, actual color, actual scale.
- Complete specs table on every product page (§5.5): dimensions, compatibility, box contents, warranty terms — the details customers rely on when they can't physically inspect the item.
- Short demo/unboxing video for higher-complexity gadgets, where feasible.
- Genuine, unedited customer reviews and photos — curated-only reviews erode the trust they're meant to build.

16.2 Catch defects before they ship

- Quality-control checklist for every unit with a battery or electronics inside: power-on test, physical inspection, accessory count, before packing.
- Photo/video proof of the item at the point of packing, attached to the order in the admin panel (§6.5) — this protects both the business and the customer in any dispute, and is especially useful for COD orders where there's no card-payment paper trail.
- Protective, purpose-appropriate packaging (anti-static bags, cushioning) to prevent transit damage — cheap insurance against a costly return.

16.3 Get the right item to the right person

- Barcode/SKU scan verification at the packing stage to catch picking errors before dispatch.
- Selected color/variant carried through cleanly from cart → order → packing label, so what's picked always matches what was ordered.

16.4 Support customers before they decide to return

- A short quick-start guide included with the product, plus a link to setup help/FAQ specific to that item — many "defective" returns are really "didn't know how to use it."

- A responsive support channel (phone/WhatsApp) that can walk a customer through setup or basic troubleshooting before a return is initiated.
- For genuine faults, offer a replacement or guided fix before defaulting straight to a refund.

16.5 Reduce COD-related "returns" at the doorstep

- Order verification call/SMS before dispatch, especially on higher-value orders — a large share of doorstep refusals are simply orders the customer forgot about or never fully committed to.
- Optional small advance deposit on COD orders flagged as higher-risk (§6.6), which meaningfully cuts down casual/fake orders.

16.6 Design the return policy to reduce ambiguity

- A clear, simple return window (e.g., 7 days) stated in plain language, with explicit conditions — unopened vs. opened, defective vs. change-of-mind — since ambiguity is what drives both customer disputes and policy abuse.
- Favor exchange or store credit over cash refund for change-of-mind returns where reasonable, protecting margin while still being fair to the customer.

16.7 Close the loop with data

- Log a return reason on every returned order (§6.5), not just the fact that it was returned.
- Review return rate by product/category regularly (§6.12) — a SKU with a persistently high return rate usually points to a fixable root cause: a misleading photo, an unclear spec, a packaging weak point, or a genuinely faulty batch. Fix the cause, not just the individual return.

This PRD is a living document. As design and development progress, sections should be updated, and decisions made in §14 should be reflected back into the relevant requirement sections above. The style direction in §15 is a proposed starting point, not a locked brand system — treat it as a base for your designer to refine once you're ready to move into high-fidelity mockups.
